

# Logo Cleanup - Old Files to Remove

## Status: Pending Asset Upload

**Before removing old files**, ensure all new branding assets have been uploaded to `/public/branding/`.

## Files Safe to Remove

### Root Level ( `/public/` )

These files are OLD and should be removed once new branding is in place:

<code>/public/catchbarrels-logo-192.png</code>	→ REMOVE (replaced by <code>/branding/logo-mark-icon.png</code> )
<code>/public/catchbarrels-logo-512.png</code>	→ REMOVE (replaced by <code>/branding/logo-mark-icon.png</code> )
<code>/public/favicon.png</code>	→ REMOVE (replaced by <code>/branding/favicon.ico</code> )
<code>/public/apple-touch-icon.png</code>	→ REMOVE (replaced by <code>/branding/logo-mark-icon.png</code> )

### Old Momentum Transfer Assets

These were from a previous branding iteration. They can be kept as backup or removed:

<code>/public/assets/logos/momentum-transfer/</code>	
├ logo-horizontal-primary.png	→ BACKUP/REMOVE (superseded)
├ logo-header.png	→ BACKUP/REMOVE (superseded)
├ apple-touch-icon-180.png	→ BACKUP/REMOVE (superseded)
├ app-icon-192.png	→ BACKUP/REMOVE (superseded)
├ logo-horizontal.png	→ BACKUP/REMOVE (superseded)
├ favicon-32.png	→ BACKUP/REMOVE (superseded)
├ app-icon-512.png	→ BACKUP/REMOVE (superseded)
├ logo-icon-512.png	→ BACKUP/REMOVE (superseded)

**Note:** Social media assets in `/public/assets/social/` are GENERATED content and should be KEPT.

## Code References Updated

All code now points to `/branding/` paths:

- ✓ `/components/layout/BarrelsHeader.tsx` → Uses `/branding/logo-horizontal.png` and `/branding/logo-mark-icon.png`
- ✓ `/app/layout.tsx` → Uses `/branding/favicon.ico`, `/branding/logo-mark-icon.png`, `/branding/social-card-default.png`
- ✓ `/app/auth/login/login-client.tsx` → Uses `/branding/logo-primary-dark.png`
- ✓ `/public/manifest.json` → Uses `/branding/logo-mark-icon.png`

---

## Cleanup Procedure

---

### Step 1: Verify New Assets Are in Place

```
ls -lh /public/branding/  
# Should show:  
# - logo-horizontal.png  
# - logo-mark-icon.png  
# - logo-primary-dark.png  
# - social-card-default.png  
# - favicon.ico
```

### Step 2: Test App Locally

```
cd /home/ubuntu/barrels_pwa/nextjs_space  
yarn dev  
# Open http://localhost:3000  
# Verify all logos display correctly  
# Check browser tab icon (favicon)  
# Test login page logo  
# Check dashboard branding
```

### Step 3: Remove Old Files (Manual)

```
# After confirming new branding works:  
rm /public/catchbarrels-logo-192.png  
rm /public/catchbarrels-logo-512.png  
rm /public/favicon.png  
rm /public/apple-touch-icon.png  
  
# Optional - remove old momentum transfer assets:  
rm -rf /public/assets/logos/momentum-transfer/
```

### Step 4: Rebuild & Verify

```
yarn build  
# Ensure no 404 errors for missing images
```

---

## Visual Verification Checklist

---

After cleanup, verify these pages:

- [ ] **Dashboard** ( /dashboard ) - Header shows new logo
- [ ] **Login Page** ( /auth/login ) - New logo in hero section
- [ ] **Video Pages** ( /video/[id] ) - Header logo correct
- [ ] **Mobile View** - Icon-only logo on mobile header
- [ ] **Browser Tab** - New favicon displays
- [ ] **PWA Install** - New app icon shows during install
- [ ] **Social Share** - Link previews use new OG image

---

## Search for Remaining References

---

If unsure whether old files are still referenced:

```
# Search for old logo references:
grep -r "catchbarrels-logo" /home/ubuntu/barrels_pwa/nextjs_space/app/
grep -r "momentum-transfer" /home/ubuntu/barrels_pwa/nextjs_space/app/
grep -r "favicon.png" /home/ubuntu/barrels_pwa/nextjs_space/app/

# Should return NO results (all updated to /branding/ paths)
```

---

## Important Notes

---

1. **Do NOT remove** `/public/assets/social/` → These are generated social media assets
  2. **Do NOT remove** `/public/branding/` → This is the NEW branding folder
  3. **Test thoroughly** before removing old files
  4. **Keep backups** of old logos if unsure
  5. **Clear browser cache** after cleanup to see new branding
